

"SUSPECTED RIFLE"

School security AI flagged clarinet as a gun. Exec says it wasn't an error.

Human review didn't stop AI from triggering lockdown at panicked middle school.

ASHLEY BELANGER – DEC 18, 2025 9:04 PM | 120

Credit: Westend61 | Westend61

A Florida middle school was locked down last week after an AI security system called ZeroEyes mistook a clarinet for a gun, reviving criticism that AI may not be worth the high price schools pay for peace of mind.

Human review of the AI-generated false flag did not stop police from rushing to Lawton Chiles Middle School. Cops expected to find “a man in the building, dressed in camouflage with a ‘suspected weapon pointed down the hallway, being held in the position of a shouldered rifle,’” a Washington Post [review](#) of the police report said.

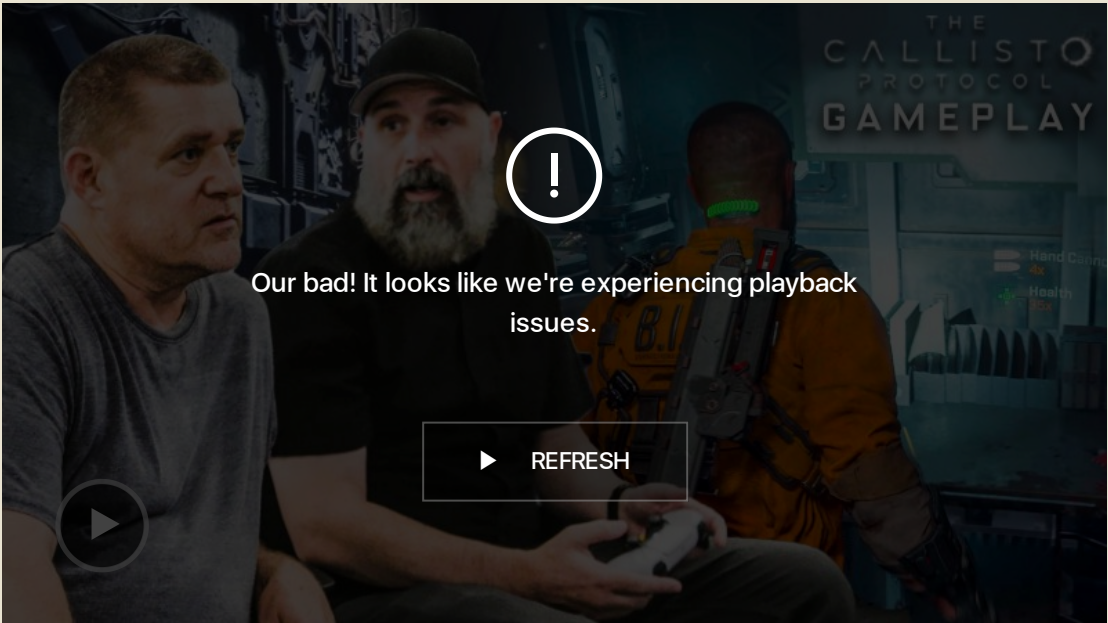

Instead, after finding no evidence of a shooter, cops double-checked with dispatchers who confirmed that a closer look at the images indicated that “the suspected rifle might have been a band instrument.” Among panicked students hiding in the band room, police eventually found the suspect, a student “dressed as a military character from the Christmas movie *Red One* for the school’s Christmas-themed dress-up day,” the Post reported.

ZeroEyes cofounder Sam Alaimo told the Post that the AI performed exactly as it should have in this case, adopting a “better safe than sorry” outlook. A ZeroEyes spokesperson told Ars that “school resource officers, security directors and superintendents consistently ask us to be proactive and forward them an alert if there is any fraction of a doubt that the threat might be real.”

“We don’t think we made an error, nor does the school,” Alaimo said. “That was better to dispatch [police] than not dispatch.”

ARS VIDEO

How The Callisto Protocol's Gameplay Was Perfected Months Before Release

Cops left after the confused student confirmed he was “unaware” that the way he was holding his clarinet could have triggered that alert, the Post reported. But ZeroEyes’

spokesperson claimed he was “intentionally holding the instrument in the position of a shouldered rifle.” And seemingly rather than probe why the images weren’t more carefully reviewed to prevent a false alarm on campus, the school appeared to agree with ZeroEyes and blame the student.

ADVERTISEMENT

“We did not make an error, and the school was pleased with the detection and their response,” ZeroEyes’ spokesperson said.

School warns students not to trigger AI

In a letter to parents, the principal, Melissa Laudani, reportedly told parents that “while there was no threat to campus, I’d like to ask you to speak with your student about the dangers of pretending to have a weapon on a school campus.” Along similar lines, Seminole County Public Schools (SCPS) communications officer, Katherine Crnkovich, emphasized in an email to Ars to “please make sure it is noted that this student wasn’t simply carrying a clarinet. This individual was holding it as if it were a weapon.”

However, warning students against brandishing ordinary objects like weapons isn’t a perfect solution. Video footage from a Texas high school in 2023 showed that ZeroEyes can sometimes confuse shadows for guns, accidentally flagging a student simply walking into school as a potential threat. The advice also ignores that ZeroEyes last year reportedly triggered a lockdown and police response after detecting two theater kids using prop guns to rehearse a play. And a similar AI tool called Omnilert made national headlines confusing an empty Doritos bag with a gun, which led to a 14-year-old Baltimore sophomore’s arrest. In that case, the student told the American Civil Liberties Union that he was just holding the chips when AI sent “like eight cop cars” to detain him.

For years, school safety experts have warned that AI tools like ZeroEyes take up substantial resources even though they are “unproven,” the Post reported. ZeroEyes’ spokesperson told Ars that “in most cases, ZeroEyes customers will never receive a ‘false positive;’” but the company is not transparent about how many false positives it receives or how many guns have been detected. An FAQ only notes that “we are always looking to minimize false positives and are constantly improving our learning models based on data collected.” In March, as some students began questioning ZeroEyes after it flagged a Nerf gun at a Pennsylvania university, a nearby K-12 private school, Germantown Academy, confirmed that its “system often makes ‘non-lethal’ detections.”

ADVERTISEMENT

One critic, school safety consultant Kenneth Trump, suggested in October that these tools are “security theater,” with firms like ZeroEyes lobbying for taxpayer dollars by relying on what the ACLU called “misleading” marketing to convince schools that tools are proactive solutions to school shootings. Seemingly in response to this backlash, StateScoop reported that days after it began probing ZeroEyes in 2024, the company scrubbed a claim from its FAQ that said ZeroEyes “can prevent active shooter and mass shooting incidents.”

At Lawton Chiles Middle School, “the children were never in any danger,” police confirmed, but experts question if false positives cause students undue stress and suspicion, perhaps doing more harm than good in absence of efficacy studies. Schools may be better off dedicating resources to mental health services proven to benefit kids, some critics have suggested.

Laudani’s letter encouraged parents to submit any questions they have about the incident, but it’s hard to gauge if anyone’s upset. Asked if parents were concerned or if ZeroEyes has ever triggered lockdown at other SCPS schools, Crnkovich told Ars that SCPS does not “provide details regarding the specific school safety systems we utilize.”

It’s clear, however, that SCPS hopes to expand its use of ZeroEyes. In November, Florida state Senator Keith Truenow submitted a request to install “significantly more cameras”—about 850—equipped with ZeroEyes across the school district. Truenow backed up his request for \$500,000 in funding over the next year by claiming that “the more [ZeroEyes] coverage there is, the more protected students will be from potential gun violence.”

AI false alarms pose dangers to students

ZeroEyes is among the most popular tools attracting heavy investments from schools in 48 states, which hope that AI gun detection will help prevent school shootings. The AI technology is embedded in security cameras, trained on images of people holding guns, and can supposedly “detect as little as an eighth of an inch of a gun,” an ABC affiliate in New York reported.

ADVERTISEMENT

Monitoring these systems continually, humans review AI flags, then text any concerning images detected to school superintendents. Police are alerted when human review determines images may constitute actual threats. ZeroEyes’ spokesperson told Ars that “it has detected more than 1,000 weapons in the last three years.” Perhaps most notably, ZeroEyes “detected a minor armed with an AK-47 rifle on an elementary school campus in Texas,” where no shots were fired, StateScoop reported last year.

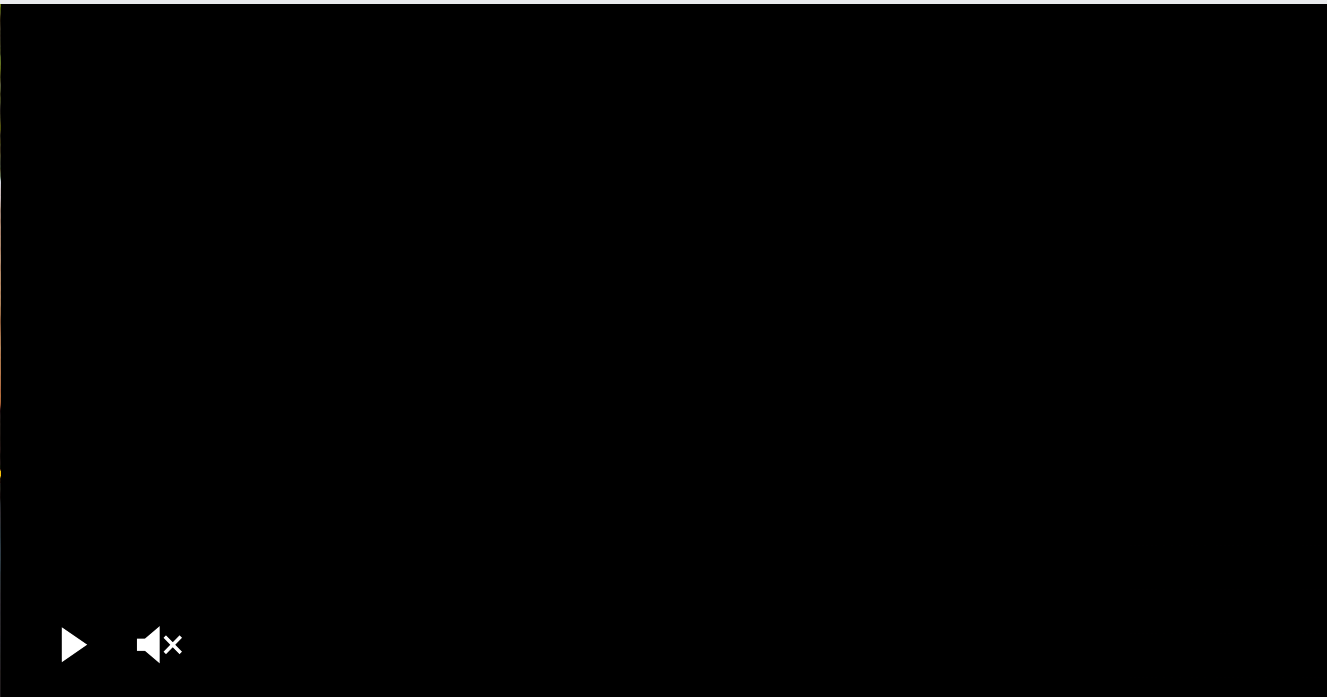

Schools invest tens or, as the SCPS case shows, even hundreds of thousands annually, the exact amount depending on the number of cameras they want to employ and other variables impacting pricing. ZeroEyes estimates that most schools pay \$60 per camera monthly. Bigger contracts can discount costs. In Kansas, a statewide initiative equipping 25 cameras at 1,300 schools with ZeroEyes was reportedly estimated to cost \$8.5 million annually. Doubling the number of cameras didn’t provide much savings, though, with ZeroEyes looking to charge \$15.2 million annually to expand coverage.

To critics, it appears that ZeroEyes is attempting to corner the market on AI school security, standing to profit off schools’ fears of shootings, while showing little proof of the true value of its systems. Last year, ZeroEyes reported its revenue grew 300 percent year over year from 2023 to 2024, after assisting in “more than ten arrests through its thousands of detections, verifications, and notifications to end users and law enforcement.”

Curt Lavarello, the executive director of the School Safety Advocacy Council, told the ABC News affiliate that “all of this technology is very, very expensive,” considering that “a lot of products ... may not necessarily do what they’re being sold to do.”

Another problem, according to experts who have responded to some of the country’s deadliest school shootings, is that while ZeroEyes’ human reviewers can alert police in “seconds,” police response can often take “several minutes.” That delay could diminish ZeroEyes’ impact, one expert suggested, noting that at an Oregon school he responded to, there was a shooter who “shot 25 people in 60 seconds,” StateScoop reported.

ADVERTISEMENT

In Seminole County, where the clarinet incident happened, ZeroEyes has been used since 2021, but SCPS would not confirm if any guns have ever been detected to justify next year’s desired expansion. It’s possible that SCPS has this information, as Sen. Truenow noted in his funding request that ZeroEyes can share reports with schools “to measure the effectiveness of the ZeroEyes deployment” by reporting on “how many guns were detected and alerted on campus.”

ZeroEyes’ spokesperson told Ars that “trained former law enforcement and military make split-second, life-or-death decisions about whether the threat is real,” which is supposed

to help reduce false positives that could become more common as SCPS adds ZeroEyes to many more cameras.

Amanda Klinger, the director of operations at the Educator’s School Safety Network, told the Post that too many false alarms could carry two risks. First, more students could be put in dangerous situations when police descend on schools where they anticipate confronting an active shooter. And second, cops may become fatigued by false alarms, perhaps failing to respond with urgency over time. For students, when AI labels them as suspects, it can also be invasive and humiliating, reports noted.

“We have to be really clear-eyed about what are the limitations of these technologies,” Klinger said.

Fuck no, this is not working as intended. It was a dangerous situation with trigger happy cops going to a school expecting a rifle. The fact that no one got hurt is good, but it should never have happened. It would not have taken a human less than a second to clear it by looking at the image, but instead we have a dumbass program looking at it and sending false information to cops, who are notorious for misinterpreting everything (I think on purpose, because they are paranoid idiots.), and doubling down when faced with evidence, as a much more dangerous situation requiring insane amount of violence instead of investigation....

So the newest iteration of "but the children!!!".

System is easily spoofed, not actually useful, costing money up front followed by money afterwards for emergency response, because some kid had a clarinet? That's laughable. Except the fact the cops came in expecting a shooter, meaning there was significant *actual* risk now, of somebody being shot or otherwise hurt. That there wasn't before, that there wouldn't be if the system had never been installed. HUH.

Everybody involved should be fired. Rinse and repeat each time. If they're not willing to fire the company...

This is not addressing any root causes for America's endemic gun violence, but throwing more money at for-profit companies with less than altruistic motives while increasing pointless surveillance that will be inevitably misused. Lovely.

insane amount of violence instead of investigation...

To add, though coverage wouldn't be great, for the same costs Kansas is looking at undertaking, that would pay roughly one school resource officer per 10 schools.

As sort of noted towards the end of the article, in general and at best, this maybe gives first responders, school staff, etc. seconds of extra notice.

Telling is the mention that they detected over a 1,000 weapons in 3 years of operation! They then make note that they have facilitated 10 arrests.

Yeah. So how many of those were real weapons? How many constituted true threats (and weren't some elementary schooler that brought a swiss army knife to school, etc.)? How many wouldn't have been spotted by staff, SROs, or students and reported and resolved anyway?

I am all about keeping kids safer, but to a degree, having more officers available likely has significantly more tangible (good) impact on school safety. Of course, that too has negatives when SROs are used to enforce school discipline.

The "actual risk" point here can't be overstated. US police training is fundamentally adversarial in nature, and if a system like this is telling them unequivocally that there's an armed assailant at a school that's what they're going to perceive, regardless of actual reality.

Think of that video where a Florida police officer starts firing because he mistook an acorn hitting the hood of his car as gunfire. Miraculously no one was injured in that case, but it's only a matter of time before this bullshit ends in tragedy.

I doubt it too, but only because humans cost money.

There's no reason "AI" couldn't watch thousands of cameras and then flag a handful of meatbags for review. It could greatly reduce monitoring costs. But that's nowhere near as cheap as just cutting the pesky meatbags out of the loop and swatting a few innocent kids here and there. Cost of doing business you know.

Yup. It does sometimes have upsides though.

A couple of years ago I got a call that my minivan had rear ended someone else in the school parking lot. Or that is what a kid was claiming. The school resource officers reviewed the camera recordings from outside the school and verified that, no, I did not rear end anyone.

Last year, my son "got into a fight" in school. What had happened was a POS bully was making fun of my son's friend and was pushing my son's friend around, and threatening to beat him up. So my son shoved him back from his friend and told him to stop. The bully punched my son right in the jaw. The wrestling coach intervened a few seconds later (he did not, or at least claimed he did not, actually see anything until he heard kids yelling about a fight).

Fortunately, it happened under a camera in the hallway right after school dismissal. Otherwise at best, nothing would have happened at all (and it wouldn't have if my ex and I had not called the school to complain), at worst they would have BOTH been suspended for fighting in school as school staff rarely take kids words for what happened (witness or not) unless a staff member witnesses it. As there was video evidence, the bully got 3-day suspension and my son got a thanking from the school vice principal for standing up for his friend.

On the flip-side, but frankly good too, it also means my daughter got recorded running away from a bathroom with her friend the last day of 6th grade. The next person into the bathroom reported it got vandalized...

Yeah. She spent her 2nd day of the summer back at the school spending 4hrs cleaning the graffiti off the stall walls. She also learned a lesson.
